Two dimensional heat equation

Deep Ray, Ritesh Kumar, Praveen. C, Mythily Ramaswamy, J.-P. Raymond

IFCAM Summer School on Numerics and Control of PDE
22 July - 2 August 2013
IISc, Bangalore
http://praveen.cfdlab.net/teaching/control2013

1 The PDE model

Let \( z = z(x, y, t) \) denote the temperature. The shifted 2-D heat equation is given by

\[
\frac{\partial z}{\partial t} = \mu \Delta z + \omega z, \quad (x, y) \in \Omega = (0, 1) \times (0, 1), \quad t \in [0, T]
\]

with boundary conditions, see figure (1)

\[
z(x, 0, t) = z(x, 1, t) = 0, \quad z(1, y, t) = u(y, t), \quad \frac{\partial z}{\partial x}(0, y, t) = 0
\]

and initial condition

\[
z(x, y, 0) = z_0(x, y)
\]

Here \( \omega \geq 0 \) and \( \mu > 0 \). Let us denote the Dirichlet part of the boundary by \( \Gamma_D \)

\[
\Gamma_D = \{ y = 0 \} \cup \{ y = 1 \} \cup \{ x = 1 \}
\]

the Neumann part as

\[
\Gamma_N = \{ x = 0 \}
\]

and the part on which the control is applied as

\[
\Gamma_c = \{ x = 1 \}
\]
1.1 Observations

We will measure an average value of the temperature on strips along the left vertical boundary

\[ I_i = [a_i, b_i], \quad i = 1, 2, 3 \]

as shown in figure (2). Thus the observations are

\[ y_i(t) = \frac{1}{b_i - a_i} \int_{a_i}^{b_i} z(0, y, t) dy, \quad i = 1, 2, 3 \]  (1)

Note: Do not confuse the observation \( y_i \) with the spatial coordinate \( y \).

1.2 Weak formulation

We assume \( z_0 \in L^2(\Omega) \). We wish to find \( z \in L^2(0, T; H^1(\Omega)) \) such that

\[
\frac{d}{dt}(z(t), \phi)_{L^2} = -\mu \int_{\Omega} \nabla z \cdot \nabla \phi dx + \omega \int_{\Omega} z \phi dx, \quad \forall \phi \in H^1_{\Gamma_D}(\Omega)
\]

\[ z(x, 0, t) = z(x, 1, t) = 0, \quad z(1, y, t) = u(y, t) \]

\[ (z(0), \phi)_{L^2} = (z_0, \phi)_{L^2} \]
Figure 2: Observations

Figure 3: Example of a finite element mesh
2 FEM approximation

Consider a division of $\Omega$ into disjoint triangles as shown in figure (3). We will assume that the vertices of the mesh are numbered in some manner. Let us define the following sets of vertices

$$
N_c = \text{vertices on } \Gamma_c \\
N_d = \text{vertices on } \{ y = 0 \} \cup \{ y = 1 \} \\
N_f = \text{remaining vertices (unknown degrees of freedom)}
$$

For each vertex $i$, define the piecewise affine functions $\phi_i(x,y)$, see figure (4), with the property that

$$
\phi_i(x_j, y_j) = \delta_{ij}
$$

We will take the control to be of the form

$$
u(y, t) = v(t) \sin(\pi y)$$

Then the finite element solution is of the form

$$
z(x, y, t) = \sum_{j \in N_f} z_j(t) \phi_j(x,y) + v(t) \sum_{j \in N_c} \sin(\pi y_j) \phi_j(x,y)
$$

The approximate weak formulation is given as

$$
\frac{d}{dt} (z(t), \phi_i)_{L^2} = -\mu \int_{\Omega} \nabla z \cdot \nabla \phi_i \, dx + \omega \int_{\Omega} z \phi_i \, dx, \quad \forall i \in N_f
$$
i.e.,
\[
\sum_{j \in N_f} \frac{dz_j}{dt} \int_{\Omega} \phi_j \phi_i + \frac{dv}{dt} \sum_{j \in N_c} \sin(\pi y_j) \int_{\Omega} \phi_j \phi_i
\]

\[
= -\mu \sum_{j \in N_f} z_j \int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i - \mu v \sum_{j \in N_c} \sin(\pi y_j) \int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i
\]

\[
+ \omega \sum_{j \in N_f} z_j \int_{\Omega} \phi_j \phi_i + \omega v \sum_{j \in N_c} \sin(\pi y_j) \int_{\Omega} \phi_j \phi_i, \quad \forall i \in N_f
\]

In order to simplify the presentation we will ignore the term containing \(\frac{dv}{dt}\) and then we can write the FEM formulation as
\[
\sum_{j \in N_f} \frac{dz_j}{dt} \int_{\Omega} \phi_j \phi_i
\]

\[
= \sum_{j \in N_f} z_j \left[ -\mu \int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i + \omega \int_{\Omega} \phi_j \phi_i \right]
\]

\[
v \sum_{j \in N_c} \left[ -\mu \sin(\pi y_j) \int_{\Omega} \nabla \phi_j \cdot \nabla \phi_i + \omega \sin(\pi y_j) \int_{\Omega} \phi_j \phi_i \right] \quad \forall i \in N_f
\]

This can be written as a system of ordinary differential equations
\[
M \frac{dz}{dt} = Az + Bv
\]

where \(z\) denotes all the unknown degrees of freedom.

### 2.1 Finite element assembly

The finite element basis functions have compact support. Hence we can compute the integrals
\[
\int_{\Omega} \phi_i \phi_j \quad \text{and} \quad \int_{\Omega} \nabla \phi_i \cdot \nabla \phi_j
\]

by adding the contributions from a small number of triangles. For example, the elements of the mass matrix can be computed as
\[
\int_{\Omega} \phi_i \phi_j = \sum_{K : i,j \in K} \int_{K} \phi_i \phi_j
\]

\(^1\text{This term vanishes if we use the trapezoidal rule for integration.}\)
and similarly the stiffness matrix is computed as

$$\int_{\Omega} \nabla \phi_i \cdot \nabla \phi_j = \sum_{K \in K} \int_{\Omega} K \nabla \phi_i \cdot \nabla \phi_j$$

The integrals on each triangle $K$ will be evaluated exactly. For a triangle $K$ with vertices labelled 1, 2, 3 as in figure (5), the local mass and stiffness matrices are given by

$$M^K = \frac{1}{24} \det \begin{bmatrix} x_2 - x_1 & x_3 - x_1 \\ y_2 - y_1 & y_3 - y_1 \end{bmatrix} \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

$$A^K = \frac{1}{2} \det \begin{bmatrix} x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \end{bmatrix} GG^T \text{ where } G = \begin{bmatrix} 1 & 1 & 1 \\ x_1 & x_2 & x_3 \\ y_1 & y_2 & y_3 \end{bmatrix}^{-1} \begin{bmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 1 \end{bmatrix}$$

The numerical process can be summarized by the following algorithm:

Set $M = 0$, $A = 0$.

For each triangle $K$ in the mesh

- Compute $M^K$ and $A^K$

- Add the contributions from $M^K$ into $M$ and from $A^K$ into $A$

More details on the assembly process can be found in this paper

http://math.tifr.res.in/~praveen/notes/control2013/acf.pdf
Figure 6: Triangular mesh with 100 edges on each side. The figure shows a zoomed view near the left boundary. Notice that the first observation zone \( \{x = 0, 0.2 \leq y \leq 0.25\} \) is exactly covered by five boundary edges.
2.2 Computing the observation

We will assume that the intervals \([a_i, b_i]\) on which the observation is computed is exactly covered by the edges of the finite element mesh, see figure (6). Let \(E_i\) denote the edges on \([a_i, b_i]\). Then

\[
y_i = \frac{1}{b_i - a_i} \int_{a_i}^{b_i} z(0, y, t) dy, \quad i = 1, 2, 3
\]

\[
= \frac{1}{b_i - a_i} \sum_{e \in E_i} \int_e z(0, y, t) dy
\]

\[
= \frac{1}{b_i - a_i} \sum_{e \in E_i} \frac{1}{2} (z_{e_1} + z_{e_2}) |e|
\]

The set of observations can be written as

\[
y = Hz
\]

The observation zones are defined by the following parameters

<table>
<thead>
<tr>
<th>Value/i</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a_i)</td>
<td>0.20</td>
<td>0.50</td>
<td>0.80</td>
</tr>
<tr>
<td>(b_i)</td>
<td>0.25</td>
<td>0.55</td>
<td>0.85</td>
</tr>
</tbody>
</table>

2.3 Grid information

The grid information consists of following files

- **coordinates.dat**: contains \(x, y\) coordinates of all the vertices
- **elements3.dat**: contains vertices forming each triangle
- **dirichlet.dat**: contains boundary edges on the dirichlet boundary
- **neumann.dat**: contains boundary edges on the neumann boundary

An example of this type of data is given in figures (7), (8). In each file, the first column is the serial number.

**Note:** In our current programs we use a mesh consisting of only triangles.

Also, the serial numbers are not stored in the files.

The domain \(\Omega\) is the unit square. The program **square.m** generates the mesh and creates the above four files. You have to specify the number of vertices on the side of the square. E.g., to have 11 points on each side, you do the following in matlab
coordinates.dat

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>

</tbody>
</table>

Figure 1. Example of a mesh.

Figure 7: Example of a mesh
coordinates.dat contains the coordinates of each node in the given mesh. Each row has the form
node # x-coordinate y-coordinate.

In our code we allow subdivision of $\Omega$ into triangles and quadrilaterals. In both cases the nodes are numbered anti-clockwise.

elements3.dat contains for each triangle the node numbers of the vertices. Each row has the form
element # node1 node2 node3.

Similarly, the data for the quadrilaterals are given in elements4.dat. Here, we use the format
element # node1 node2 node3 node4.

<table>
<thead>
<tr>
<th>elements3.dat</th>
<th>elements4.dat</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 13</td>
<td>1 1 2 13 12</td>
</tr>
<tr>
<td>2 3 4 13</td>
<td>2 12 13 14 11</td>
</tr>
<tr>
<td>3 4 5 15</td>
<td>3 13 4 15 14</td>
</tr>
<tr>
<td>4 5 6 15</td>
<td>4 11 14 9 10</td>
</tr>
<tr>
<td></td>
<td>5 14 15 8 9</td>
</tr>
<tr>
<td></td>
<td>6 15 6 7 8</td>
</tr>
</tbody>
</table>

neumann.dat and dirichlet.dat contain in each row the two node numbers which bound the corresponding edge on the boundary:
Neumann edge # node1 node2 resp. Dirichlet edge # node1 node2.

<table>

Figure 8: Structure of mesh files

When you run the above program, you can see a picture of the mesh. Examine the four files created by this program. For our actual computations, we will use 101 points on each side of the square. In this case, there are 5 edges which exactly cover each of the three observation zones.

3 Parameters and initial condition

Let us take
$$\mu = \frac{1}{50}, \quad \omega = 0.4$$

Then the heat equation has one unstable eigenvalue given by
$$\lambda = -\frac{\pi^2}{40} + \omega = 0.015325988997$$

The corresponding eigenfunction is
$$\phi(x, y) = \cos(\pi x/2) \sin(\pi y)$$

which is shown in figure (9). We will use the unstable eigenfunction as the initial condition.
Figure 9: Unstable eigenfunction
for the heat equation. This initial condition satisfies the following boundary conditions
\[ \phi(x, 0) = \phi(x, 1) = \phi(1, y) = 0, \quad \phi_x(0, y) = 0 \]

4 Excercises I

1. Generate the mesh by running the square program and use 81 points on each side of the square.

2. The value of \( \omega \) is set in the file parameters.m. Set \( \omega = 0 \) and calculate five eigenvalues with largest real part using eigs function. Is there an unstable eigenvalue?

3. With \( \omega = 0 \), run the program. Observe that the energy is decreasing with time. The energy is plotted with linear scale for time and log scale for energy. The straight line behaviour indicates that the energy is decaying exponentially wrt time.

4. With \( \omega = 0 \), find the decay rate of the solution.

5. Set \( \omega = 0.4 \) and calculate five eigenvalues with largest real part using eigs function. Is there an unstable eigenvalue? Compare it with exact unstable eigenvalue given above.

6. With \( \omega = 0.4 \), run the program. Observe that the energy is increasing exponentially with time.

5 Feedback control

The feedback control is determined by solving the lqr problem using the matrices M, A and B. Since the dimensions of these matrices are very large, we determine the feedback matrix K by considering only the unstable components of the system.

6 Excercises II

1. Set \( \omega = 0.4 \). In fem_50.m, insert the code to determine the the feedback matrix \( K \) using only the unstable components (in this case, there will be just one unstable component). Refer back to the codes for the 1D heat problem if needed. Remember to modify the matrix A1 in the code accordingly. Run the code.

2. Save the matrix \( K \) obtained above. Set \( \omega = 0 \) and load \( K \) into the code instead of evaluating it. Run the code and observe the decay rate of the solution. Is it as expected?
7 Estimation and control

We now consider the case where we have partial observation as discussed in the previous sections. Thus we need to solve the estimation problem. This requires the evaluation of the filtering gain matrix $L$. Once again, the large dimensions of the system matrices forces us to evaluate $L$ using only the unstable components.

8 Excercises III

1. Set $\omega = 0.4$. In `fem_50_est.m`, insert lines of code to determine $K$ as above, and to evaluate $L$ using just the unstable components. You will need the matrix $H$ which is already generated by `get_matrices.m`. Run the code and observe the solution.

2. Save the matrix $K$ and $L$ obtained above. Set $\omega = 0$ and load these matrices into the code instead of evaluating them. Run the code and evaluate the decay rate of the solution. Is it as expected?

9 List of matlab programs

The programs are under the directory `heat_2d`.
